SUMMARY

B.E. Computer Science Engineering graduate (June 2026) building toward a DevOps career through hands-on cloud, containerization, and CI/CD work. Deployed a two-stage ML pipeline (CNN segmentation + Random Forest classification) as a working diagnostic system, with direct experience in environment setup, model serving, and the infrastructure decisions that go into taking a model from notebook to working application. Comfortable with Linux administration, scripting, and version control, and actively building toward production-grade automation and cloud deployment skills.

TECHNICAL SKILLS

Cloud Platforms	AWS (EC2, S3, IAM, VPC) — hands-on via personal/academic projects; Google Cloud Platform (GCP) — coursework and certification
Containers & Orchestration	Docker, Docker Compose, Kubernetes (fundamentals)
CI/CD & Version Control	Git, GitHub, GitHub Actions (fundamentals)
Operating Systems	Linux (Ubuntu) administration, shell scripting, basic networking
Programming & Scripting	Python, Bash, SQL, C/C++ (academic)
ML / Data Tooling	TensorFlow, Keras, Scikit-learn, OpenCV — applied in deployed project below
Other	REST APIs, Power BI, IoT-based data pipelines (mini project)

PROJECTS

GeoProteoNet — Fetal Anemia Diagnostic System

Aug 2025 – Present

Major project, B.E. final year | Supervisor: Ms. Nabeela Fatima | Team of 3 | Python, TensorFlow, Keras, Scikit-learn, OpenCV, React, FastAPI

- Built and deployed a two-stage diagnostic pipeline: a custom CNN encoder-decoder for Doppler ultrasound image segmentation, feeding hemodynamic features (PSV, EDV, RI, PI, S/D ratio) into a Random Forest classifier — achieving 93.99% Dice Coefficient and 92.90% F1-score.
- Set up the full local development and model-serving environment from scratch, managing Python/TensorFlow dependency conflicts and GPU configuration to get training and inference running reliably.
- Built a React/FastAPI diagnostic dashboard to serve model predictions as a usable clinical-style application, handling the API layer between the trained model and the frontend.
- Worked across the system end-to-end — from data pipeline and model training through to a deployable application — giving direct exposure to the kind of environment, dependency, and deployment problems DevOps work is built to solve.

Sustainable Farming Recommendation System

Jan 2025 – Apr 2025

Mini project | IoT, Machine Learning, SQL, Power BI

- Designed an IoT-to-database pipeline ingesting sensor data (soil moisture, temperature) into SQL, with an ML model generating crop recommendations from the processed data.
- Built Power BI dashboards to visualize sensor trends and recommendation outputs for end users.

EDUCATION

Muffakham Jah College of Engineering and Technology (MJCET), Hyderabad

Graduated Jun 2026

Bachelor of Engineering (B.E.), Computer Science Engineering

CERTIFICATIONS

- Microsoft Learn — AI/ML Fundamentals
- Cisco — AI and Data Science
- SimpliLearn — Machine Learning
- HP LIFE — Data Science
- Forage Job Simulations — JPMorgan Chase, TATA, Deloitte
